# Yellow.ai: An Indian-Origin NLP Startup

---

**Course Code:** CSI4001 – Natural Language Processing and Computational Linguistics
**Author:** Monish K **Register Number:** 23MID0315
**Date:** August 2026

## Abstract

Natural Language Processing (NLP) is an important area of Artificial Intelligence that enables computers to understand and process human language. One of its major applications is conversational AI, where users communicate with computer systems through text or voice. Yellow.ai is an Indian-origin enterprise AI company that develops conversational solutions for businesses. Originally known as Yellow Messenger, the company was founded by Raghu Ravinutala, Jaya Kishore Reddy Gollareddy, and Rashid Khan.

This paper discusses the origin, founders, products, customers, technologies, and growth of Yellow.ai. It also explains how NLP is used to understand user requests, identify intent, support multiple languages, and automate conversations. Yellow.ai is a useful example of how NLP can be applied to solve practical business problems.

***Keywords:*** *Natural Language Processing, Conversational AI, Yellow.ai, Chatbots, Voice AI, Enterprise Automation.*

## 1. Introduction

Natural Language Processing, commonly called NLP, is a branch of Artificial Intelligence that allows computers to understand, interpret, and generate human language. It is used in applications such as machine translation, virtual assistants, search engines, sentiment analysis, and chatbots.

Conversational AI is one of the most common applications of NLP. Businesses receive a large number of customer queries through websites, applications, messaging platforms, and telephone calls. Answering every query manually requires time and human resources. Conversational AI helps automate common interactions while allowing human agents to handle more complicated situations.

Yellow.ai is an example of a company that uses NLP for this purpose. It provides AI-based systems that automate communication between organizations and their customers or employees. The platform supports both text and voice interactions.

## 2. Origin and Founders

Yellow.ai originated in Bengaluru, India and was initially known as Yellow Messenger. The startup was created to make communication between businesses and customers faster and easier.

Traditional customer support often required users to wait for a human representative through phone calls or emails. The founders believed that messaging platforms and conversational interfaces

could provide a more convenient method of communication.

The company was founded by Raghu Ravinutala, Jaya Kishore Reddy Gollareddy, and Rashid Khan. Raghu Ravinutala is the Chief Executive Officer and has played an important role in the company's growth. Jaya Kishore Reddy Gollareddy contributed to the technological development of the platform, while Rashid Khan was involved in product development.

Over time, Yellow Messenger expanded beyond simple chatbots and developed into a broader enterprise AI platform. The company later adopted the name Yellow.ai to represent its wider focus on Artificial Intelligence.

## 3. Products and Services

Yellow.ai provides an enterprise platform for automating communication. Its major services include:

- Conversational AI
- Voice AI
- Customer service automation
- Employee assistance
- Integration with enterprise systems

Conversational AI allows users to communicate using natural language. For example, a customer may ask, "Where is my order?" The system must understand the request, identify the user's intention, retrieve the required information, and provide a suitable response.

This involves NLP tasks such as understanding user input, identifying intent, extracting important information, maintaining conversation context, and generating an appropriate response.

Yellow.ai also supports voice interactions. Speech recognition converts spoken language into text, after which NLP techniques process the request. The final response can be converted back into speech.

The platform can also assist employees by answering questions related to HR, leave, payroll, IT support, and internal company policies.

## 4. Customers and Technology

Yellow.ai mainly focuses on enterprise customers. Its technology can be used in industries such as banking, retail, e-commerce, telecommunications, healthcare, travel, automotive services, and technology.

The platform has been associated with organizations such as Sony, Domino's, Hyundai, Volkswagen, ITC, and Ferrellgas.

Natural Language Understanding is an important part of the platform. Different users may ask the same question in different ways. For example, "Where is my package?", "Track my order", and "I have not received my delivery" have a similar intention.

NLP models help the system identify the meaning of such queries and extract important information such as order numbers, dates, or locations.

Another important feature is multilingual communication. This is particularly useful in India, where users communicate in English and many regional languages. The platform also supports communication through websites, mobile applications, messaging platforms, and voice channels.

## 5. Innovation and Business Growth

Earlier chatbot systems mainly depended on fixed rules and predefined conversation flows. Modern generative AI systems can understand more flexible language and generate responses based on the context of a conversation.

Yellow.ai has moved toward generative and agentic AI. An AI agent can perform tasks by interacting with external tools or business systems. For example, instead of simply answering an order-related question, the system may retrieve the order details and provide the delivery status.

However, generative AI can sometimes provide incorrect information. Therefore, enterprise AI systems require reliable data sources, proper controls, and security.

The assignment requires the selected startup to have annual revenue above five crore rupees. Yellow.ai clearly satisfies this requirement. Publicly available information has reported its revenue in the range of hundreds of crores in recent financial years.

The company follows a business-to-business model by providing AI technology to enterprises. Its growth shows that NLP and conversational AI can be developed into large-scale business solutions.

## 6. Challenges and Conclusion

Conversational AI provides many benefits, but it also has limitations. Human language is often ambiguous, and the same sentence can have different meanings depending on context. Maintaining context during long conversations can also be difficult.

Generative AI systems may sometimes produce inaccurate information. Privacy and security are also important because enterprise AI systems may process customer information. Multilingual NLP creates additional challenges because languages differ in grammar, vocabulary, and expressions.

In conclusion, Yellow.ai is a strong example of how Natural Language Processing can be transformed into a practical business application. The company originated in India as Yellow Messenger and later developed into a global enterprise AI platform.

Founded by Raghu Ravinutala, Jaya Kishore Reddy Gollareddy, and Rashid Khan, the company provides conversational AI, voice automation, and customer service solutions. Its platform uses important NLP concepts such as language understanding, intent recognition, context management, multilingual processing, and response generation.

Yellow.ai clearly meets the required revenue condition and demonstrates how NLP can be combined with software engineering and business systems to solve real-world communication problems.
